Counterfog Technology Bioaerosol Fast Sampler (BIAFTS)

Our laboratory at Centro de Biología Molecular Severo Ochoa (CBMSO), a biomedical research institute of the Spanish National Research Council (CSIC), has collaborated with Counterfog to test the efficacy of the Bioaerosol Fast Sampler (BIAFTS) to capture viruses present in aerosols.

Initial experiments done with aerosols containing the bacteriophage Phi29, a model virus, have demonstrated that BIAFTS efficiently captures Phi29 present in aerosols, with the same efficiency (100%) as the PTFE (Teflon) filters, previously demonstrated to capture virus-containing aerosols and used as a control. See Example 1.

In addition, the Counterfog technology BIAFTS was able to capture SARS-CoV-2 in the air of a hospital room with COVID-19 patients at Hospital Universitario Fundación Alcorcón, which was detected with a SARS-CoV-2 specific RT-qPCR carried out in our laboratory. See Example 2.

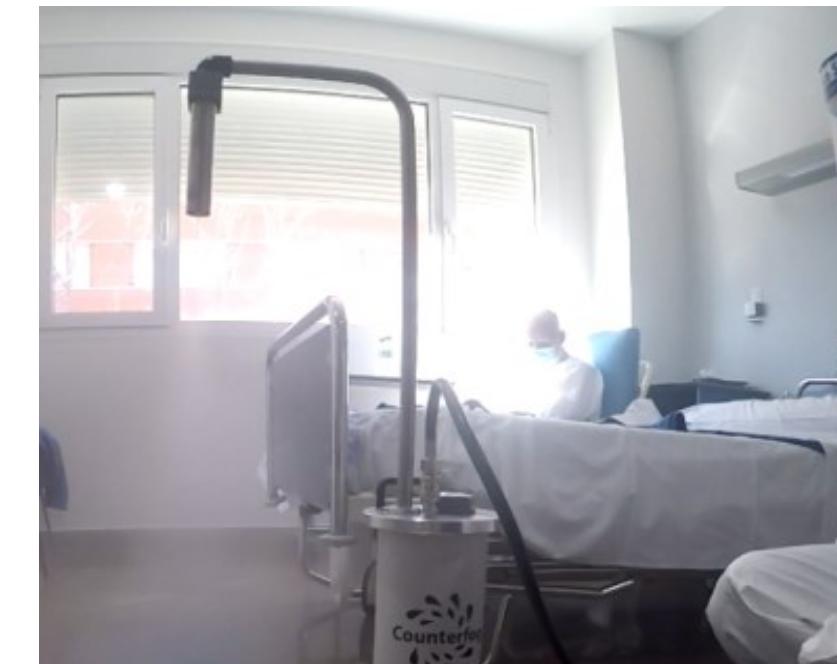

These results demonstrate the utility of the BIAFTS technology developed by Counterfog to capture viruses in aerosols. The technology is expected to capture other human and animal pathogens present in aerosols, and will have many applications in the control of airborne infectious diseases and future pandemics.
